Transform wood waste into valuable soil amendment

Farmers and scientists are rediscovering **Biochar** – a valuable soil amendment that can decrease the need for pesticides and watering, and increase soil health and production.

Biochar is a very stable form of carbon, and improves soil structure, water retention, and nutrient availability, leading to healthier and more productive soils. Biochar also helps fight climate change by capturing carbon in the soil rather than releasing it to the atmosphere.

It was the basis of Terra Preta, or Black Earth, found throughout the world where ancient people enriched their soil to allow it to produce abundant crops.

Biochar is made by burning organic matter at high heat in the absence of oxygen.

Mobile biochar services are now available in southern New England to transform your wood waste into Biochar.

We can process up to three yards of wood per day on-site into raw biochar, suitable for use in barns or in composting.

We can also provide inoculated biochar for use in your gardens.

Contact us at biocharct@gmail.com to discuss logistics and pricing.
